

Amazon India Fashion: 6 Business Problems Solved with Data

A data-driven analysis of Amazon India's fashion segment — uncovering hidden revenue leaks, geographic blind spots, and untapped opportunities through SQL and Power BI.

High Cancellation Rate Bleeding Revenue

Amazon India was losing **13.32% of all orders** — **17,185 out of 128,975** — before delivery. In fashion, cancellations lock inventory, incur logistics costs, and can't be reassigned in real time.

The highest-revenue categories had the highest cancellation rates — losing the biggest bets most frequently. Root causes: poor size guides, inaccurate images, COD-driven impulse orders.
Fix: Size standardization, better listings, Try-Before-You-Buy for high-value Sets.

Saree — 14.69%

Kurta — 14.66%

Set — 14.60%

PROBLEM 2

Revenue Was Declining — With No Visibility

Revenue fell **18.8%** in **just two months** — from ₹2.70 Crore in April to ₹2.19 Crore in June. Total revenue of ₹7.34 Crore sounded healthy until the downward trend line was visible. Even the best-performing category — **Set** — was losing revenue each month. The Power BI dashboard made this trend immediately visible to non-technical stakeholders, enabling leadership to investigate marketing spend and seasonal demand.

No Geographic Strategy — Money Left on the Table

Maharashtra alone generated ₹1.24 Crore — nearly equal to Karnataka and UP combined. Dozens of low-revenue states consumed equivalent logistics and marketing attention.

Using **NTILE(3)**, every state was classified into **Top Tier**, **Mid Tier**, and **Low Tier** — enabling targeted investment rather than blanket spend.

Top Tier

Invest heavily

Mid Tier

Nurture with campaigns

Low Tier

Minimize burn

Merchant Fulfilment Was Underperforming

Amazon suspected FBA performed better than Merchant-fulfilled orders — but had no quantified comparison to act on.

Amazon Fulfilled (FBA)

65.1% of order volume → 69.3% of revenue. Higher average order value.

Merchant Fulfilled

Dragging down per-order revenue average, likely contributing disproportionately to returns and cancellations due to less standardized handling.

Action: Migrate high-value merchant sellers to FBA or introduce fulfillment quality incentives tied to seller ratings.

Category Strategy Was Based on Assumption, Not Data

KURTA:
HIGHEST ORDER COUNT,
BUT LOWER PER-ORDER VALUE.
NEEDS RETURN REDUCTION
STRATEGY.

SET:
FEWER ORDERS,
BUT HIGHEST REVENUE (3 MOs).
HIGHEST PER-ORDER VALUE.
PRIORITIZE AD SPEND
& SHELF PLACEMENT.

The assumption was that **Kurta** — the highest order count category — was the top revenue generator.

In fact, **Set consistently outperformed every other category in all three months**, despite fewer orders, because its per-order value was significantly higher.

Corrected strategy: Set gets priority shelf placement, premium ad spend, and exclusive launch slots. Kurta needs a return-reduction strategy, not more orders.

B2B Segment Was Invisible and Ignored

With only **794 B2B orders out of 128,975 total (0.62%)**, Amazon India's fashion business operated as pure B2C. But B2B buyers — boutiques, resellers, corporate gifting, uniform suppliers — place large, recurring, high-value orders with low return rates.

Without measurement, the segment couldn't be managed or grown. This finding creates a business case for a dedicated B2B program: bulk pricing tiers, account managers, and a separate B2B portal — diversifying revenue without new customer acquisition spend.

Summary: Problems, Impact & Actions

#	Problem	Impact	SQL Queries	Recommendation
1	High cancellation rate	₹~1 Cr+ at risk	Q10, Q15	Fix listings, size guides, COD policy
2	Declining monthly revenue	-18.8% in 2 months	Q12, Q17	Investigate marketing & demand drivers
3	No geographic strategy	Resources spread thin	Q8, Q16	Tiered state investment framework
4	Merchant vs FBA gap	Lower AOV on merchant orders	Q14	Migrate high-value sellers to FBA
5	Wrong category assumptions	Kurta over-invested, Set under-invested	Q9, Q17	Prioritize Set in ad spend & promotions
6	B2B segment invisible	Untapped bulk revenue	Q6	Launch dedicated B2B program

From Data to Decisions

This analysis demonstrates that data work is only valuable when it connects findings to real business consequences and actionable decisions. That's what separates a **data analyst** from a data entry person.

→ Quantify the problem

Use SQL to expose hidden patterns in cancellations, revenue trends, and segment gaps.

→ Visualize for stakeholders

Power BI dashboards make trends immediately visible to non-technical leadership.

→ Recommend with precision

Targeted fixes — not blanket policies — drive real operational change.
